the authors consider scalar lattice differential equations posed on square lattices in two space dimensions under certain natural conditions they show that wave like solutions exist when obstacles characterized by holes are present in the lattice their work generalizes to the discrete spatial setting the results obtained in berestycki hamel and matuno 2009 for the propagation of waves around obstacles in continuous spatial domains the analysis hinges upon the development of sub and super solutions for a class of discrete bistable reaction diffusion problems and on a generalization of a classical result due to aronson and weinberger that concerns the spreading of localized disturbances

the authors consider operators of the form in a bounded domain of where are nonsmooth hörmander s vector fields of step such that the highest order commutators are only hölder continuous applying levi s parametrix method the authors construct a local fundamental solution for and provide growth estimates for and its first derivatives with respect to the vector fields requiring the existence of one more derivative of the coefficients the authors prove that also possesses second derivatives and they deduce the local solvability of

constructing by means of a solution to with hölder continuous the authors also prove estimates on this solution

computational rheology for pipeline and annular flow develops and applies modern analytical and computational finite difference methods for solving flow problems in drilling and production it also provides valuable insights into flow assurance analysis in subsea pipeline design using modeling techniques that simulate the motion of non newtonian fluids e g power law bingham plastic and herschel bulkley flows this book presents proven annular flow methodologies for cuttings transport and stuck pipe analysis based on detailed experimental data obtained from highly deviated and horizontal wells these methods are applied for highly eccentric borehole geometries to the design of pipeline bundles in subsea applications where such annular configurations arise in velocity and thermal modeling applications also covered extensively are the design and modeling of pipelines having non circular cross sections where deviations from ideal circular geometries arise from plugging due to wax deposition and the presence of hydrates and asphaltenes as in the case of annular flows the new algorithms apply to fluids with general rheological
